EDUCATION

Northeastern University, Khoury College of Computer Sciences

Master of Science in Computer Science

Related courses: Computer Systems, Algorithms, Web Development

Fr. Conceicao Rodrigues College of Engineering, Mumbai, India

Bachelor of Engineering in Computer Engineering

Related courses: Data Structures and Algorithms, Software Engineering, Machine Learning

Sept 2025 – Present

Expected graduation: December 2027

GPA: 3.5/4.0

July 2021 – June 2025

GPA: 9.50/10.0

TECHNICAL KNOWLEDGE

Frontend: JavaScript, TypeScript, React, HTML, Tailwind CSS, responsive design

Backend: Node.js, Python, Java (Spring Boot), Hono, REST APIs, OpenAPI, real-time communication

Databases: PostgreSQL, MongoDB, MySQL, Redis

Cloud & DevOps: Firebase, GCP (Cloud Run, Cloud Scheduler), Cloudflare Workers, Docker, CI/CD pipelines, Git, AWS, Vercel, Render

Systems: Event-driven messaging (RabbitMQ), microservices

Real-Time: Socket.io, WebSocket, asynchronous communication, event-driven workflows

Developer Tools: Supabase, Drizzle ORM, Turborepo, Claude Code, Cursor, GitHub Copilot

WORK EXPERIENCE

Software Engineering Intern

Jan 2025 – July 2025

Marine Electricals (India) Private Limited

Mumbai, India

- Designed IoT-based control systems using Schneider EcoStruxure platform, deploying PLC monitoring across 500+ electrical loads achieving 99.9% uptime
- Built real-time SCADA monitoring dashboards for power distribution tracking across 12 substations, reducing fault detection time by 40%
- Collaborated cross-functionally with engineering teams to translate real-world operational requirements into monitoring features

PROJECTS

Odyssey, Fullstack Restaurant Operations Dashboard

July 2026

- Designed and shipped a production-grade fullstack ops dashboard for Ody, architected as a pnpm/Turborepo monorepo with an Expo/React Native web frontend and a Hono backend on Cloudflare Workers, backed by Neon Postgres and Drizzle ORM
- Built a one-directional codegen pipeline (Drizzle schema to Zod to OpenAPI to generated React Query hooks), eliminating hand-written API client code and keeping frontend types in sync with the database
- Designed a six-status order state machine with a single source-of-truth transition table and server-side price snapshotting, rejecting client-supplied totals to guarantee data integrity
- Wrote 48 automated tests across backend, shared, and frontend packages; authored architecture and trade-off documentation covering design rationale and known gaps

NexusNU, Social Networking Website

Sept 2025 – Dec 2025

- Took ownership of a consumer-facing feature end-to-end, from UI design through deployment, shipping a full-stack MERN app used by 100+ Northeastern students
- Designed a responsive React and Tailwind CSS frontend, optimizing layouts and interaction patterns for both mobile and desktop to keep the experience fast and intuitive
- Built the backend in Node.js/Express with authentication and access control, and collaborated across the stack to keep frontend and backend behavior consistent for the end user
- Shipped real-time messaging and notifications with Socket.io, backed by MongoDB schemas for Users, Posts, Events, and Connections
- Built a real-time job search feature with autocomplete by integrating third-party APIs (JSearch, ESCO), focused on making search feel instant and reliable
- Deployed the app (Vercel/Render) with CI/CD and optimized media delivery, directly improving perceived app performance

Artory.ai, Full-Stack Development

April 2026 – Present

- Took technical ownership of backend features for a production AI platform, from design through deployment, supporting 100+ active users
- Profiled and debugged performance bottlenecks in the data pipeline, cutting response latency 51% (7,900ms to 3,900ms) to make the product feel faster for end users
- Built secure API integrations with authentication so client-facing features could reliably read and write data in real time
- Designed the PostgreSQL data layer in Supabase and optimized queries to keep user-facing features responsive under load
- Used AI-assisted tools (Claude Code) to iterate quickly on features while maintaining code quality, reflecting curiosity about new tools and workflows

Motiv8 Fitness Application

July 2025 – Dec 2025

- Architected 6-service microservices platform using Spring Boot with event-driven messaging (RabbitMQ) for asynchronous data flow
- Designed database schemas across PostgreSQL and MongoDB and implemented real-time inter-service communication using WebClient with load balancing and error handling
- Containerized backend services with Docker Compose for single-command deployment across a distributed system
